The number of marriage and family therapists, clinical social workers and mental health counselors with active licenses in Florida. Other behavioral healthcare professionals, such as psychologists or school psychologists, are not included in this total. Data reported is a census of licensed professionals taken in the 4th quarter of the year reported and reflects the count of licensed professionals with active, clear licenses with in-state mailing addresses. Military and civilian providers are included. Licensure data are for a fiscal year (July 1-June 30). The specialty information for medical doctors is reported voluntarily and is neither required nor verified by the Department.

LSF Utilization Data

In this section there are county level tables as well as circuit level tables. Due to the length of some of the tables a circuit level table was created for easier access to all circuits for comparison purposes. The circuit level table will be at the beginning of the table and then the county level table will be after. They will have slightly different headings but will all have the same number.

Data was generally provided by All Programs, Adult Mental Health(AMH), Adult Substance Misuse(ASM), Child Mental Health (CMH) and Child Substance Misuse(CSM), therefore each type of program data was shown in tables.

Client demographics are provided by program type. Gender, race, ethnicity, age groups, highest level of education completed, residential status, employment, and income status are all shown for the number of clients LSF saw between Fiscal Year 2021-2022 and 2023-2024.

The total number of services are broken out by year and program type. Number of services were also shown by year, program type and service description.

Estimated Costs and Estimated Uncompensated costs were shown by year and program type and covered service.

The number of clients added to the waiting list and the average number of days on the wait list were shown by program type.

There was also recovery client data shown by program types.

A list of covered services was shown along with which were considered core services.

Technical Notes

2020 U.S. CENSUS DATA

The 2020 U.S. Census data provides the official counts of the population and housing units for the nation, counties, cities and towns. In the past, short and long forms were sent out every ten years. Now, only the short forms are sent out every ten years. Information collected on the long forms in the past are now asked on the annual American Community Surveys. 2020 Census data is shown for the population in various breakouts to show the official counts by county and state level.

AMERICAN COMMUNITY SURVEY DATA

The American Community Survey (ACS) data is released in one-year or five-year estimates depending on what level of data is shown. Traditionally, short forms and long forms were sent out to addresses every 10 years. The American Community Survey was designed to replace the long form and it is now sent to only a sample of the population once each year instead of every ten years so that ongoing estimates may be available. The ACS reports contain estimates, not the official counts. The U.S. Census states that you should not compare 2010 or 2020 Census numbers to ACS data; it also suggests that you only compare ACS data when the data are different sets of years. Therefore, to compare 2005-2009 ACS data you would not compare it with any other set until the 2010-2014 data is released. Three year estimates have been released in the past, but are no longer being released. Individual sets of years of data for the ACS may be compared to each other. Please remember that the ACS data are not the actual count rather, it is a sample of the population over the selected time period. For more detailed information on the American Community Survey please refer to <https://www.census.gov/programs-surveys/acs/guidance/comparing-acs-data/2014.html>.

BEHAVIORAL RISK FACTOR SURVEILLANCE SYSTEM (BRFSS) DATA

The Florida Department of Health conducts the Behavioral Risk Factor Surveillance System (BRFSS) with financial and technical assistance from the Centers for Disease Control and Prevention (CDC). This state based telephone surveillance system collects self-reported data on individual risk behaviors and preventative Health practices related to the leading causes of morbidity and mortality in the United States. BRFSS indicators are summarized only at the state and county level. Not all of the indicators were available for the latest release.

CRUDE VERSUS AGE-ADJUSTED MORTALITY RATES

Both the crude and the age-adjusted death rates (AADR) are displayed in this report. Crude rates are merely the actual number of deaths for a given cause for a desired population divided by total number in the desired population and then multiplied by 100,000 to get the rate per 100,000 population, while AADR represent crude rates adjusted to standardize the population distribution effects on the rate.

Although useful for certain purposes, the crude death rate as a comparative measure has a major shortcoming. It is a function of the age distribution of the population at risk. For example, the population at risk in one county may be primarily elderly persons ages 65 and older while the population at risk in

another county may be primarily of persons ages 40 to 50. Crude rates are recommended when a summary measure is needed and it is not necessary or desirable to adjust for other factors.

The frequency with which Health events occur is almost always related to age. In fact, the relationship of age to risk often dwarfs other important risk factors. For example, acute respiratory infections are more common in children of school age because of their immunologic susceptibility and exposure to other children in schools. Chronic conditions, such as arthritis and atherosclerosis, occur more frequently in older adults because of a variety of physiologic consequences of aging. Mortality rates tend to increase after the age of 40.

Because the occurrence of many Health conditions is related to age, the most common adjustment for public Health data is age adjustment. The age-adjustment process removes differences in the age composition of two or more populations to allow comparisons between these populations independent of their age structure.

The age-adjusted death rate is a summary measure that eliminates the effect of the underlying age distribution of the population. The result is a figure that represents the theoretical risk of mortality for a population, if the population had an age distribution identical to that of a standard population. For example, a county's age-adjusted death rate is the weighted average of the age-specific death rates observed in that county, with the weights derived from the age distribution in an external population standard, such as the U.S. Population.

Age-adjustment then allows for the comparison of two distinct populations (for example, Hamilton County versus Florida) which most likely have differing age distributions. The age effects are in essence removed from the rates and the age-adjusted death rate then no longer reflects the actual death rate but is an indicator rate that can be used for relative comparisons.

In the past, the National Center for Health Statistics (NCHS) age-adjusted rates using the US 1940 standard population. Other agencies used the U.S. 1970 Standard. Beginning with 1999 data, federal agencies began age-adjusting to the U.S. 2000 Standard Million Population.

Zip Code level crude and age-adjusted rates are shown in a separate tables and the county rates and Florida rates are shown as well. These data should not be compared to tables that have only county and Florida rates in them. Population sources are different and these rates should not be compared.

EMERGENCY DEPARTMENT (ED) DATA

For tables with emergency department data please note that this data only includes emergency department visits in which emergency department registration occurs and the patient is not admitted for inpatient care at the reporting entity. Data is shown for mental Health and substance misuse patients and is broken out for all ages, children < 18 years of age and adults 18+ years of age. Data broken out by race is also shown.

FLORIDA DRUG-RELATED OUTCOMES SURVEILLANCE & TRACKING SYSTEM (FROST)

The FROST system is a data dissemination tool developed to centralize and provide access to a wide range of drug-related outcome data in Florida. It is used for public Health surveillance, research, and policy development, particularly in addressing the opioid epidemic. The data includes mortality figures, rates, and

demographic breakdowns, serving as a critical resource for monitoring trends in substance misuse and related public Health issues. This data is compiled from the Florida Department of Law Enforcement's Medical Examiners Commission reports as well as Florida Bureau of Vital Statistics.

Florida medical examiners, throughout the state, investigated 34,274 deaths in 2023, identifying substance misuse in 14,798 of those deaths, according to their 2023 annual report.

HEALTH PROFESSIONAL SHORTAGE AREAS (HPSA) DATA

HPSAs may be designated as having a shortage of primary medical care, dental or mental Health providers. They may be urban or rural areas, population groups or medical or other public facilities. Possible types of HPSA Designations in the area include:

Geographic Single County - Where the whole county is designated as HPSA.

Geographic Service Area - Where portions of a county, or portions of multiple counties are designated as a geographic HPSA.

Population Group - Where a population within an area is designated as a HPSA.

Correctional Institutions - Federal and State prisons and youth detention facilities.

Comprehensive Health Centers - Entities receiving Section 330 funds to operate comprehensive Health centers.

FQHC Look-a-Like - Federally Qualified Health centers certified as meeting 330 requirements but not receiving grant funds.

Rural Health Clinic - Certified as Rural Health Clinics by the Centers for Medicare and Medicaid Services.

HPSA Scores are developed for use by the National Health Service Corps in determining priorities for assignment of clinicians. Scores range from 1 to 25 for primary care And Mental Health, 1 to 26 for dental Health. The higher the score, the greater the priority. All Federally Qualified Health Centers and those Rural Health Clinics that provide access to care regardless of one's ability to pay, receive automatic facility HPSA designation. These facilities may have a HPSA score of 0.

INCOMES

Various income data is shown by zip codes and levels from the latest 5-year ACS estimates.

INPATIENT HOSPITALIZATIONS

A general overview of discharges and patient days are shown for mental Health and substance misuse patients. Data is broken out by all ages and children < 18 years of age and adults 18+. Data is also shown by races and ethnicities.

INTERNATIONAL STATISTICAL CLASSIFICATION CODES (ICD)

This is the international “standard diagnostic tool for epidemiology, Health management and clinical purposes”. ICD 10 codes were used in various tables in this report.

SUBSTANCE MISUSE DEATH DATA FROM FLORIDA CHARTS

The death data codes used to pull the substance misuse deaths included ICD 10 Codes (F10-F19), (X40-X44), (X60-X64), (U01.6-U01.7, X85-X90) and (Y10-Y14). These include the following: F10 Alcohol related disorders; F11 Opioid related disorders; F12 Cannabis related disorders; F13 Sedative, hypnotic, or anxiolytic related disorders; F14 Cocaine related disorders; F15 Other stimulant related disorders; F16 Hallucinogen related disorders; F17 Nicotine dependence; F18 Inhalant related disorders; F19 Other psychoactive substance related disorders; (X40-X44) Unintentional: Poisoning by Drugs and Biological Substances; (X60-X64) Suicide: Drugs and Biological Substances; (U01.6-U01.7, X85-X90) Homicide: Drugs, Biological And Noxious Subs; (Y10-Y14) Undetermined Intent: Poisoning by Drugs and Biological Substances.
